

Muskegon Lake AOC Habitat Restoration

The Bear Creek Restoration Project will restore fish passage and remove sediments that contain harmful levels of phosphorus, restoring natural water flow and native fish and wildlife habitat.

Project Highlights

- ◆ Restore 36 acres of wetlands to improve water flow and fish passage to Muskegon Lake
- ◆ Remove approximately 182,735 tons of harmful sediment from wetlands along Bear Creek
- ◆ Restore 2,015 feet of stream bank
- ◆ Provide habitat for native fish, turtles, frogs, songbirds, mammals, migrating birds and waterfowl
- ◆ Complete restoration of Muskegon Lake to remove it from the list of Great Lakes Areas of Concern (AOCs) or “toxic hotspots” as early as 2018
- ◆ Funding is provided by the Great Lakes Restoration Initiative (GLRI) and U.S. Environmental Protection Agency (EPA) through the National Oceanic and Atmospheric Administration (NOAA) and the Great Lakes Commission (GLC)
- ◆ The West Michigan Shoreline Regional Development Commission is implementing this project
- ◆ The Annis Water Resources Institute is monitoring the impact of restoration on the aquatic ecosystem

Environmental Benefits

Reconnecting natural floodplain wetlands to Muskegon Lake
Michigan Department of Natural Resources (DNR) Fisheries goal

Economic Benefits

Enhance the fishery of Muskegon Lake, which is conservatively estimated at \$1.3 million annually

Community Benefits

Muskegon County acquired the property for the purpose of fish and wildlife habitat restoration and water quality improvements

Background of the AOC

Within the lower Muskegon River watershed, lies the Muskegon Lake AOC, a drowned river mouth lake that flows into Lake Michigan at a shoreline that is part of the world's largest assemblage of freshwater sand dunes. Muskegon Lake was designated an AOC in 1985 due to ecological problems caused by industrial discharges, shoreline alterations and the filling of open water and coastal wetlands. Since 1992, community groups, governmental and nongovernmental organizations have worked collaboratively to remediate contaminated sediments and to restore and protect fish and wildlife species and their habitats. Historic sawmill debris, foundry sand and slag filled 798 acres of open water and emergent wetlands in the AOC. Nearly 25% of Muskegon Lake's open water and shallow wetlands were filled, and approximately 74% of the shoreline was hardened with wood pilings, sheet metal and concrete. This resulted in the loss and degradation of shallow water communities, isolation and fragmentation of coastal wetlands, and the associated degradation of water quality and fish and wildlife populations. With completion of this and several other projects in development, the U.S. EPA now expects to remove Muskegon Lake from the list of Great Lakes "toxic hotspots" as early as 2018.

History of the Creek

One of the barriers to delisting Muskegon Lake as an AOC is eutrophication, an un-naturally high level of phosphorus in Bear Lake. High phosphorus levels in Bear Lake are a result of fertilizers used at an earlier celery farm located on two ponds along Bear Creek near where it enters Bear Lake. The installation of earthen berms between the celery farm ponds and Bear Creek also prevented water and fish passage between the wetlands, Bear Lake and Muskegon Lake.

Project Progress

In 2013, funding from the NOAA Coastal and Estuarine Land Conservation Program allowed Muskegon County to purchase the ponds in preparation for restoration work. The Muskegon Lake Watershed Partnership and several private property owners are also coordinating with project partners to support restoration of the site. Today, pre-restoration monitoring is underway to assess surface and groundwater quality and fish and wildlife within the project area. During the spring of 2016, native fish and wildlife will be relocated and water will be pumped to the Muskegon County Wastewater Treatment System. Sediment from behind the dike will be removed before the creek is re-joined to its natural floodplain by removing an artificial earthen dike. Native vegetation will be planted as part of the restoration process. Major construction will be in full swing during the summer of 2016.

"This project will be instrumental to the overall health of Muskegon Lake by removing harmful sediments and creating the conditions that native fish and wildlife need to thrive in these waterways."

-Kathy Evans
WMSRDC Project Manager

Funding and Partners

Approximately \$7.9 million is available for this project through the GLRI, a regional program that is supporting implementation of a comprehensive restoration plan for the Great Lakes, including cleaning up the AOCs. The project funding comes from NOAA through a partnership with the GLC. The project is being managed locally by the West Michigan Shoreline Regional Development Commission (WMSRDC) and ecological monitoring is being performed by the Grand Valley State University Annis Water Resources Institute.
